TASK 5: SALES DATA ANALYSIS

Key Insights and Business Interpretation | Movie Analytics

1. Executive summary

The Power BI report displays approximately 7K in total sales, six movie titles, eight customers and an Average Order Value of 714.00. The Sales Status calculation shown in the model uses 10,000 as its achievement threshold. Since displayed sales are approximately 7K, the current report indicates that the target has not been achieved.

The charts show Sci-Fi as the leading genre, Neon Dreams as the leading movie title, and Pune as the highest-revenue city. Thriller and Comedy are among the lower-revenue genres; Shadow Protocol and Laugh Out Loud are the lower-ranked titles. Chennai is the lowest-revenue city among those displayed.

2. Sales performance and target achievement

Measure	Screenshot result / interpretation
Total Sales	Approximately 7K
Target threshold	10,000
Target status	Not achieved
Movie titles	6
Customers	8
Average Order Value	714.00

Management should monitor sales against the target over time and investigate whether the gap is related to booking volume, ticket quantity, ticket price, discounts or booking fees. Confirm the exact figures from a refreshed model before formal presentation.

3. Product and genre trends

The Revenue by GENRE chart ranks Sci-Fi first, followed by Action and Adventure. Drama sits in the middle, while Comedy and Thriller are the lower-ranked categories. The movie chart ranks Neon Dreams first, then Galaxy Warriors and Ocean Secrets. The Last Kingdom is mid-ranked; Laugh Out Loud and Shadow Protocol are lowest among the six displayed titles.

Business interpretation: the leading genres and titles appear to be the strongest revenue drivers. Maintain suitable show-time availability and test focused promotions for these titles. For lower-ranked titles, review audience demand, screening times and marketing reach before changing the schedule. Lower revenue alone does not prove a title is unprofitable.

4. City and customer trends

Pune and Hyderabad are the two strongest cities in the Revenue by CITY chart. Mumbai follows, then Bengaluru, with Chennai lowest among the five displayed cities. The report contains eight customers, so conclusions about customer retention or customer segments should be treated as preliminary.

Use CUSTOMER_TYPE, BOOKING_CHANNEL and PAYMENT_METHOD to investigate which segments and channels contribute to bookings. Sustain effective activity in Pune and Hyderabad, and investigate local demand, title mix, show timings and channel performance in Chennai and Bengaluru before reallocating capacity or marketing budgets.

5. Profitability and margin assessment

The visible fields include REVENUE, BOOKING_FEE, DISCOUNT, TICKET_PRICE and TICKET_QUANTITY. No direct cost, operating expense or profit field is visible. Therefore, the current model supports revenue analysis but does not support a reliable calculation of profit, gross margin or net margin.

To assess profitability, add relevant cost data such as film licensing/distribution costs, venue or screening costs, payment-processing fees and other attributable expenses. Then calculate Profit = Revenue – Total Costs and Profit Margin % = Profit ÷ Revenue. Until costs are included, do not label the highest-revenue genre or movie as the most profitable.

6. Business recommendations

Area	Recommended action	Monitor
High-performing genres	Support Sci-Fi, Action and Adventure with suitable show times and targeted campaigns.	Revenue, tickets and bookings by genre.
Low-performing titles	Test offers, show-time changes and targeted promotion for lower-ranked titles.	Bookings and revenue before/after campaigns.
City planning	Review demand in Chennai and Bengaluru; sustain effective activity in Pune and Hyderabad.	Monthly revenue and ticket quantity by city.
Customer retention	Use customer type and booking channel to identify segments; test repeat-booking offers.	Repeat-customer rate and revenue per customer.
Inventory / capacity	Adjust show capacity using booking and occupancy trends, not one snapshot.	Tickets sold per show and occupancy, if capacity data is added.
Profit margins	Add cost data and monitor profit and margin before discounting decisions.	Profit and margin % by title, genre and city.

7. Ongoing dashboard monitoring

Review the dashboard monthly against the 10,000 sales target and the previous month. Monitor total sales, transactions, average order value, ticket quantity, revenue by genre, movie and city, and booking-channel mix. Once cost data is added, include profit and profit-margin KPIs so commercial decisions consider both revenue and profitability.

8. Conclusion

The current dashboard identifies revenue leaders by genre, movie and city, and indicates that sales are below the configured target. Opportunities include building on demand for leading titles, investigating lower-performing categories and cities, and using customer and channel data to improve retention. Profitability conclusions remain pending because cost data is not present in the visible model.

Source and limitations

This report is based on the Power BI screenshots and field names previously supplied in this conversation. The 7K, six movies, eight customers and 714.00 values are transcribed from the report screenshot. Genre, movie and city rankings are interpreted visually; exact category totals, retention rates, inventory utilisation and profit margins cannot be confirmed from the screenshots alone.
